

The Strive for Excellence.

I wanted to make it better. I wanted to take the old and improve on it.

This was ingrained in my mind ever since I was a young kid meticulously picking away at lego blocks and finding new ways to place them to make a better creation.

This skill has carried on throughout my life and now has molded into an essential trait that I carry throughout every task I am faced with.

Passion.

Doing what one loves is an important fuel for creativity and productivity. Being an avid programmer and a member of UCSD's Dragonboat team, the reward of overcoming obstacles together through teamwork is one of the most satisfying feeling one can feel.

This is what motivates me. This is why I love doing what I do.

2048 Game

Join the numbers and get to the 2048 tile!

Mini GUI module of the game 2048 with extra features implemented using Java. This game features easy to use controls and a smooth design interface. This variant of the game was created by myself while attending UC San Diego during my early days of programming.

Blackjack

Website-based project done in a course at UCSD. This project combines a large variety of HTML, CSS, and Javascript to create a poker table layout. The game features accurate win/loss conditions based off of the dealer and each hand combination, a random number generator for dealing cards, and a simple easy-to-use UI. Specific design aspects such as the background UI were modified to make the game more pleasing to the eye.

My Portfolio

This site gives you a little snippet of who I am, what I've done, and everything you need to know about my professional portfolio. This portfolio was not made with the help of any template but instead was made from scratch using HTML and CSS. This was a solo project made by myself.

Rising Edge

Team Rising Edge is a group of 6 dedicated engineering UCSD students set out to design a music website with a goal in mind: improvement.

Our desire for improvement gave birth to an idea that we can make the music world interact closer with one another. We wanted listeners to be able to connect with their favorite artists through a multitude of ways such as the option of being able to request an artist to perform at a venue. Our three main targets are: normal listeners like me or you, artists/bands, and venues. Together, we aim to connect these three to create the perfect trifecta of communication in the music world.

Making our Brand

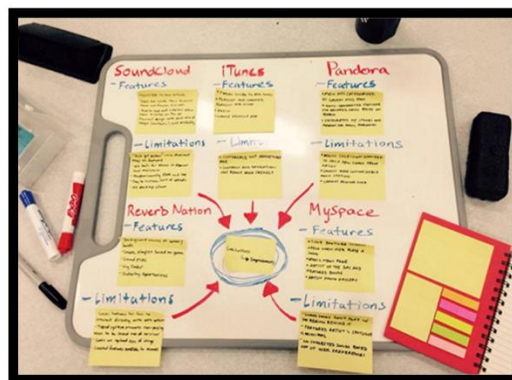

To get the gears rolling, our first objective was to create a logo to brand our website. Each person in our team produced a sketched rough draft of the logo. Voting on the three that we liked, we set out to create a more refined version of the three. At last, we found finalized our logo design and are ready to tackle the next step.

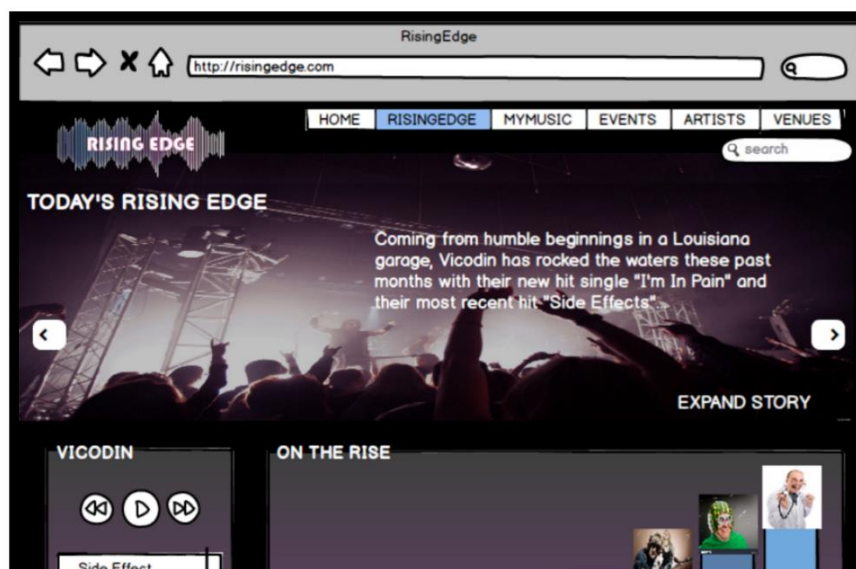

Analyzing our Competitors

In order to fully understand how to market our website and to rise to the top, we needed to do some competitive analysis of our main competitors in which we narrowed down and mapped out their key features and flaws:

Prototyping

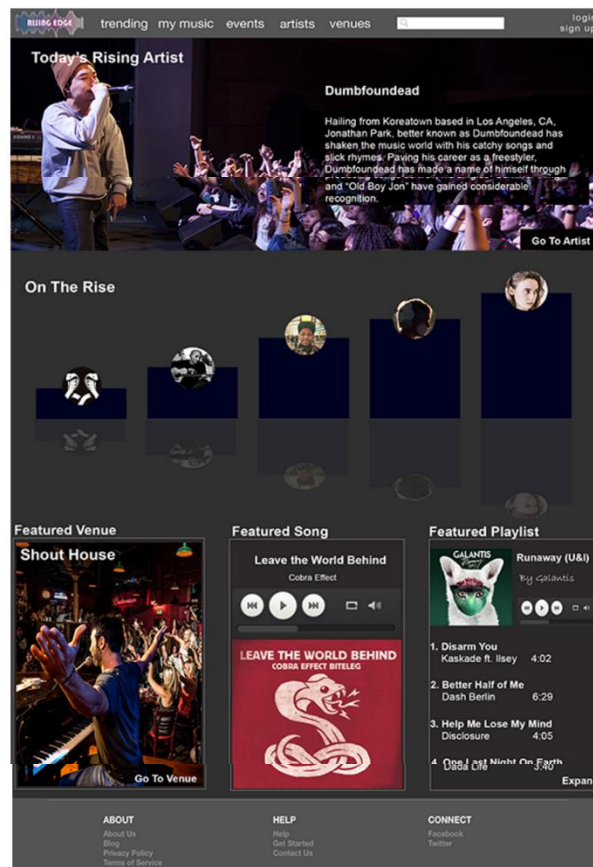

After mapping out how our website would ultimately function, we confirmed our website's goal and set out to planning its content and layout. Using Balsamiq, a prototyping tool, what each tab on our website would look like. For me, I worked on the Trending Page which

The Finished High Fidelity Website

At last as we reached our final stages of discussing and designing the content strategy of our webpage, we began to garnish the website aesthetically. Using photoshop, we were able to each create a page for the website and mount it on Invision to fully see how our website would operate. After reviewing everything and fixing some bugs here and there, we have our finished high fidelity website.

Brian Vu

Software Engineer/Front-End Developer

EXPERIENCE

UCSD Office of Admissions and Relations: La Jolla, CA —
Campus Ambassador

October 2015 - PRESENT

- Represented UCSD in hosting visitors and prospective students through

EDUCATION

University of California
San Diego

Bachelor of Science in
Computer Science and

- Represented UCSD in hosting visitors and prospective students through campus guided tours.
- Efficiently managed large campus outreach events such as recruitment activities both on and off campus.

UCSD Dragon Boat Team: San Diego — Senior Coach

October 2015 - PRESENT

- Dedicated time to teach new members for the team through training both on and off the boat.
- Trained daily as a team to race competitively internationally.

Lasan/St. John Vianney: San Jose — Vietnamese Language Instructor

October 2011 - June 2013

- Provided instruction on Vietnamese culture and language to grade school students.
- Readily designed and prepared lesson plans that cultivated a positive learning environment.

PROJECTS

Mini game: 2048

- Developed a GUI based version of the game 2048 using Java.

BlackJack Card Game

- Utilized CSS formatting along with Javascript/XHTML to recreate an easy to use web-based game interface.

NHL News Page

- Designed a webpage using Javascript/XHTML/CSS that displays a complete up to date news feed of current events happening in the NHL.

Computer Science and
Engineering

June 2018

SKILLS

Programming Languages:

Java | JavaFX | Javascript |
X/HTML/CSS | C programming |
Python

IDE's and Relevant Tools:

- Fluent with VIM/GVIM, Eclipse, Dr. Java, PyCharm.
- Knowledgeable with Git, makefiles, file sharing, and PC/Mac/Linux systems.
- J/UNIT testing and test driven development.
